The objective of this exam is to test your understanding of weeks 11 and 12 of the CIS 194 Spring 2013 course (applicative functors and monads).

Name

1. (1 point (bonus)) In week 9, we studied functors, which allow us to map a function over some structure:

```
class Functor f where fmap :: (a \rightarrow b) \rightarrow f a \rightarrow f b instance Functor Maybe where fmap = Nothing = Nothing fmap f (Just x) = Just (f x)
```

In weeks 10 and 11, we studied applicative functors, which allow us to map a function contained over some structure over some structure:

And, in week 12, we studied monads:

```
class Applicative m => Monad m where instance Monad Maybe where (>>=) :: m a -> (a -> m b) -> m b Nothing >>= \_ = Nothing Just x >>= k = k x
```

Monads are more powerful than functors and applicative functors because they allow us to remove a level of structure using the join function:

Define join:

```
join :: Monad m => m (m a) -> m a
join mmx =
```

(Hint: Use id and remember that m is a Monad.)

2. (1 point) The bind operator, (>>=), sequentially composes two actions, passing any value produced by the first as an argument to the second. Write (>>=) in terms of fmap and join:

```
(>>=) :: Monad m => m a -> (a -> m b) -> m b
mx >>= k =
```

3. (1 point) Consider the following function:

What is the result of mapA Just [1,2,3]?

- A. [1,2,3]
- B. Just [1,2,3]
- C. [Just 1, Just 2, Just 3]
- D. Nothing
- 4. (2 points) Consider the following function:

```
sequenceA :: Applicative f => [f a] -> f [a]
sequenceA = mapA id
```

- (a) What is the result of sequenceA [Just 1,Nothing,Just 3]?
 - A. [1,3]
 - B. Just [1,3]
 - C. [Just 1, Just 3]
 - D. Nothing
- (b) What is the result of sequenceA [Just 1, Just 2, Just 3]?
 - A. [1,2,3]
 - B. Just [1,2,3]
 - C. [Just 1, Just 2, Just 3]
 - D. Nothing
- 5. (1 point) Consider the following functions:

```
replicate :: Int -> a -> [a]
replicate n x = take n (repeat x)
```

replicateA n fx = sequenceA (replicate n fx)

What is the type of replicateA?

- A. Functor $f \Rightarrow Int \rightarrow f a \rightarrow f [a]$
- B. Int -> f a -> f [a]
- C. Applicative $f \Rightarrow Int \rightarrow f a \rightarrow f [a]$
- D. Applicative $f \Rightarrow Int \rightarrow f a \rightarrow [f a]$
